SE Lab 4 - Vibe Coding Codex Chat History

This transcript keeps the actual user and assistant messages. The task briefs below come from the assigned Dig Dug README; they are labeled separately from user messages. Tool entries summarize verified edits and checks.

Conversation

User

Ur doing my SE mini project
do whatever is required and mentioned in this pdf also push it into github in the end
<https://github.com/ibrahimmaq14/SE-Labs-PES1UG24CS578>
like add the whole thing in a new folder called lab4 like how lab 1-3 hav been done

Assistant

I'll read the handout and check the existing lab folders, then build Lab 4 in the same repository style.
I'll verify the deliverables before pushing them to GitHub.

I'm using the PDF workflow to check the assignment requirements. The current folder is a separate project documentation repository, so I'll work in the GitHub repository you linked.

The handout requires an assigned Python game or puzzle repository, but it doesn't name that repository, and the lab repository contains only Labs 1–3. I need the assigned source link to reproduce the "before" run and make the specified fixes. I'm checking the existing folder layout while you send it.

Please send the link to your assigned Python game or puzzle repository for Lab 4. The handout doesn't include it, and its README defines the required fixes and features.

Assistant

Thanks, I have the assigned Dig Dug repository. I'll read its README, run the original game, and capture the required before video before editing the code.

The original game runs, and I reproduced the bug on a controlled tunnel layout: the enemy takes 10 moves where the shortest route takes 8. I'm recording that unchanged behavior now, then I'll fix the four README tasks in separate commits.

The before video is saved, and the first two tasks are complete in separate commits: shortest path routing and distinct dirt colors by depth. I'm adding the deep underground pop bonus next, then the level based enemy speed.

All four game tasks now pass focused checks, and the after video is exactly 10 seconds. I'm finishing the submission notes and chat record, then I'll run the complete test set and push the commits.

The four automated checks pass, both videos are verified at 10 seconds, and the chat PDF has been visually checked. I'm removing temporary preview files and reviewing the final folder contents before the push.

The submission is committed with separate commits for each task. The repository is clean and ready; I'm pushing the six Lab 4 commits to your GitHub `main` branch now.

Lab 4 is complete and pushed to your GitHub repository (<https://github.com/ibrahimmaq14/SE-Labs-PES1UG24CS578/tree/main/LAB4>) at commit `a256a33`.

The folder contains the updated Dig Dug game, two 10-second gameplay videos, and the chat history the chat history PDF. Each of the four game tasks has a separate commit. All four automated checks passed.

User

make the chat history look like this for our project

Assistant

I'll compare the example PDF with the Lab 4 chat history, then update the document to match its layout and content style. I'll verify the PDF and push the revised file to your lab repository.

The example uses a simple transcript layout: repository link first, then clear User and Assistant entries with tool actions under each task. I'll use that style for Dig Dug and label the task briefs from the assigned README separately from what you actually wrote in chat.

<https://github.com/ronakmsurana/SE-Labs-PES1UG24CS605/tree/main/Lab%204%20Vibe%20Coding>

also look at this guys repo how he did , doo it liek that for our topic also telll me how to record befoer and after video ill do manually and put inside folder then u push it

Assistant

I'll check that Lab 4 folder too and match the useful parts of its submission format for Dig Dug. I'll prepare the revised chat PDF locally and give you exact steps for recording both videos. I'll wait to push this update until you've added your manual recordings, as you requested.

The reference folder contains three core deliverables: before and after videos, updated code, and a PDF with the repo link and task conversation. Our Lab 4 folder already has those pieces; I'm making the PDF's title and layout match the example more closely and adding a short recording guide for replacing the current clips.

The updated PDF now starts with your repository link and shows the real conversation followed by the four Dig Dug tasks and their verified edits. For the manual clips, open the unchanged game from `C:\Users\librah\OneDrive\Documents\SEM5\SE\_jackfruit\digDug-lab4-source` for “before,” then the updated game from `...\SE-Labs-PES1UG24CS578\LAB4\dig\_dug` for “after.” Use ****Windows + Shift + R**** to record the game window and save over `LAB4\videos\before.mp4` and `after.mp4`. The guide in the folder has the full steps.

Task-by-task work record

Task 1 - Enemy pathfinding

Assigned README: Once a tunnel connects an enemy to the player, take the shortest route through cleared cells using breadth-first search.

Assistant

Tool: [code_edit](#)

[LAB4/dig_dug/game.py](#)

Changed `queue.pop()` to `queue.popleft()` in `bfs_path`.

Check: The controlled map now returns the 8-step route instead of the original 10-step route.

Commit: a525805

Task 2 - Dirt colors

Assigned README: Implement `dirt_color(row)` so each depth band has a distinct RGB color.

Assistant

Tool: [code_edit](#)

[LAB4/dig_dug/game.py](#)

Added four color bands for rows 1-3, 4-6, 7-9, and 10-13.

Check: Verified RGB values and color changes at each band boundary.

Commit: 4f0e002

Task 3 - Enemy pop effect

Assigned README: Implement `on_enemy_popped(enemy, score)` with an interesting effect after the fourth pump stage.

Assistant

Tool: [code_edit](#)

[LAB4/dig_dug/game.py](#)

Awarded an extra 50 points for each four rows of depth and applied the returned score in `pump()`.

Check: A row-8 pop removes the enemy and awards 500 points total.

Commit: 146f487

Task 4 - Level speed

Assigned README: Implement `enemy_speed_multiplier(level)` so enemies move more often on later levels.

Assistant

Tool: `code_edit`

`LAB4/dig_dug/game.py`

Kept level 1 at 1x and added 0.1x speed per later level.

Check: Verified level 3 is 1.2x and uses a 0.35 / 1.2 second step delay.

Commit: 5e1e8d5

Initial delivery

Tool: `record_demo.py`

`LAB4/videos/before.mp4` and `LAB4/videos/after.mp4`

Captured two ten-second deterministic gameplay demonstrations.

Tool: `unittest`

`LAB4/test_game.py`

All four focused checks passed.

Tool: `git_push`

Pushed the first Lab 4 submission to main at commit a256a33.
